IT Project

The main content of this project is to make a website that can handle the flow of information reasonably. Its values are that people can browse the files needed for downloading information with confidence, without worrying about downloading viruses. At the same time, the efficiency of downloading information and the search speed are faster. The method is to set up a website, search all the information about the keyword immediately after the customer inputs the keyword, and comprehensively analyze whether the information contains viruses, if not, push it to the customer, and if so, blacken the information source.

Flow Chart

Flow Chart

Make sure what the real objective is.Then you can design the steps to achieve it.

Determine the objective

Collecting the information and suggestion from clients and staff to make plan.

Collect the message

About hardware and software

In our hardware, the hard disk adopts Samsung hard disk, which has a large amount of memory and very fast data processing speed. The protection technology of firewall is also the most advanced at present. Moreover, we use Huawei's infinite WiFi, which can read data quickly and cover a wide range We use Amazon's RDS software to store a large amount of data.
